

You know it, I'm sure: You are developing a data transformation using lots of pipes. Then you need to remove a line. So far so good. But if it's the last line you want to remove a simple comment will produce an error because of the pipe. Here's a solution:

Pipes

Magrittr

Let's say you are computing something like this:

```
1 options(tidyverse.quiet = TRUE)
2 library(tidyverse)
3 options(dplyr.summarise.inform = FALSE)
4
5 starwars %>%
6   mutate(
7     mean_height = mean(height, na.rm = TRUE)
8   ) %>%
9   group_by(species, gender) %>%
10  summarize(
11    mean_height_species_gender = mean(height, na.rm = TRUE),
12    mean_height = first(mean_height)
13  ) %>%
14  mutate(
15    diff_mean_height = mean_height_species_gender - mean_height
16  ) %>%
17  select(gender, species, diff_mean_height) %>%
```
